1 Processors

This interim update of the “Sector and Regional Profiles of the North Pacific Groundfish Fisheries” focuses on processors. Two separate documents focusing on catcher vessels and regions are also available at this web site. These sector profiles were originally included in Appendix I of the Alaska Groundfish Fisheries Draft Programmatic Supplemental Environmental Impact Statement published by the National Marine Fisheries Services-Alaska Region (NMFS-AKR) in January 2001. The original release contained fishery data up through 1998, while this interim update adds data for 1999 and 2000.

Because of the high level of interest in the public release of current data—in part due to the effects of management measures to reduce impacts of the groundfish fisheries on Steller sea lions—this interim update is being made available in an expedited manner and does not contain detailed explanatory text. A fully documented version of the updated sector profiles is scheduled for release in September 2001. It is assumed that users of this interim update can refer to the original Sector Profiles for additional documentation. A copy of the original Sector Profiles is available electronically at the following NMFS-AKR web site: <http://www.fakr.noaa.gov/sustainablefisheries/seis/default.htm>.

A catcher processor uses various gears to catch fish and process them into products onboard the vessel. Five catcher processor classes were defined for this document. These definitions are based on the predominant product type or gear type associated with these vessels. These classes are mutually exclusive. The acronyms and associated definitions are shown in Table 1.

Table 1.1-1. Catcher Processor Acronyms and Definitions

Acronym	Description
ST-CP	Surimi Trawl Catcher Processor. These factory trawlers have the necessary processing equipment to produce surimi from pollock and other groundfish. They are generally the largest of all catcher processors.
FT-CP	Fillet Trawl Catcher Processor. These trawl vessels have the processing equipment to produce fillets from pollock, Pacific cod, and other groundfish. They are generally smaller than ST-CPs.
HT-CP	Head And Gut Trawl Catcher Processor. These factory trawlers do not process more than an incidental amount of fillets. Generally, they are limited to headed and gutted products or kirimi. In general, they do not focus their efforts on pollock, opting instead for flatfish, Pacific cod, and Atka mackerel. HT-CPs are the smallest of the trawl catcher processors.
P-CP	Pot Catcher Processor. These vessels have been used primarily in the crab fisheries of the North Pacific, but increasingly are participating in the Pacific cod fisheries. They generally use pot gear, but may also use longline gear. They produce whole or headed and gutted groundfish products, some of which may be frozen in brine rather than blast frozen.
L-CP	Longline Catcher Processor. These vessels, also known as freezer longliners, do not trawl or use pot gear but use longline gear with a focus on Pacific cod. Most L-CPs are limited to headed and gutted products, and in general are smaller than HT-CPs.

Note: A vessel can fit into only one vessel class during any given year but may fall into a different class from year to year.

Inshore plants include traditional shorebased plants that process Alaska groundfish and several floating processors that are moored or anchored nearshore in protected bays and harbors. Seven inshore processing or mothership classes were defined for this document, primarily based on the regional location of the facilities. The Bering Sea pollock inshore plants (BSP-SP) are defined as such because

of the scale and magnitude of their groundfish operations compared to other processor classes. These classes are mutually exclusive. The acronyms and associated definitions for the six sectors are shown in Table 2.

Table 1.1-2. Inshore Processing Sector Acronyms and Definitions

Acronym	Description
BSP-SP	Bering Sea Pollock Inshore Plants. Includes the four major shorebased BSAI pollock processors in Dutch Harbor/Unalaska and Akutan. Also includes two inshore floating processors— <i>Arctic Enterprise</i> and <i>Northern Victor</i> —that have had substantial pollock history and function from a single location in state waters off Unalaska and Akutan Islands
APAI-SP	Alaska Peninsula and Aleutian Islands Inshore Plants. Includes all shore plants in the Aleutians East Borough and in the Aleutians West Census Area, excluding all BSP-SPs. In general, these plants are much smaller than BSP-SPs, do not have the same level of focus on BSAI pollock, and in some cases produce more salmon than groundfish. These plants are treated separately from the BSP-SPs because of these operational differences.
K-SP	Kodiak Inshore Plants. This class includes all shore plants in the Kodiak archipelago. Many of these plants focus on groundfish but also process some salmon and halibut. Others focus on salmon and halibut but also process some groundfish.
SC-SP	Southcentral Alaska Inshore Plants. This class includes all shore plants in the Kenai Peninsula Borough, the Municipality of Anchorage, the Matanuska-Susitna Borough, and the Valdez-Cordova Census Area. In general, these processors focus on salmon and halibut but also process some groundfish.
SE-SP	Southeast Alaska Inshore Plants. This class includes all shore plants in Southeast Alaska from Yakutat to Ketchikan. In general, these processors focus on salmon and halibut, but also process some groundfish, primarily high-value species such as rockfish and sablefish.
MS	Motherships Operating in the BSAI or GOA. This class includes all motherships operating in the EEZ. Currently there are only three active motherships. This class does not include floating processors that operate exclusively in state waters.
FLT	Floating Inshore Plants. This class includes all inshore floating processors.

This document contains a separate section for each processor class. Each section presents a series of tables that describe the involvement of the processor class in the groundfish fisheries. The first set of tables shows landings weight and product value by species, target fishery and trimester (January-April, May-August and September-December). A second set of tables provides estimates of employment and payments to labor in the processing sector.

The owners and employees of processors reside in communities located in regions in or out of Alaska. Table 3 identifies geographic regions that were defined specifically for this document. Processing facilities process a number of species, including both groundfish and non-groundfish. In an effort to provide a relatively uniform description of the activities of each of the types of processors and to report as much of the processing data as allowed under the rule of confidentiality, this document has aggregated the groundfish species into various groups, as shown in Table 3. Confidentiality restrictions require that any disclosure of data be aggregated to include the operations of at least three processing facilities.

Table 3. Regional Classes and Species Aggregations

Acronym	Region (Boroughs, Census Areas, Municipalities, and Counties Included)
AKAPAI	Alaska Peninsula and Aleutian Islands Region. Includes the Aleutians East Borough and the Aleutians West Census Area.
AKSC	Southcentral Alaska Region. Includes Valdez-Cordova Census Area, Kenai Peninsula Borough, Matanuska-Susitna Borough, and the Municipality of Anchorage.
AKKO	Kodiak Region. Includes the Kodiak Island Borough and other parts of the Kodiak archipelago.
AKSE	Southeast Alaska Region. Includes Yakutat Borough, Skagway-Hoonah-Angoon Borough, Haines Borough, City and Borough of Juneau, City and Borough of Sitka, Wrangell-Petersburg Census Area, Prince of Wales-Outer Ketchikan Census Area, and Ketchikan Gateway Borough.
WAIW	Washington Inland Waters Region. All counties bordering Puget Sound and the Strait of Juan de Fuca, including Clallum, Island, Jefferson, King, Kitsap, Mason, Pierce, San Juan, Skagit, Snohomish, Thurston, and Whatcom.
ORCO	Oregon Coast Region. Counties bordering the Northern Oregon coast including Lincoln, Tillamook, and Clatsop.
OTHER	Includes all other boroughs, census areas, municipalities and counties in the United States.
Acronym	Species Aggregation
ARSO	Atka mackerel, all rockfish species, sablefish, and other groundfish
FLAT	ALL FLATFISH SPECIES (EXCLUDES HALIBUT, NOT A GROUNDFISH)
PCOD	Pacific cod
PLCK	pollock
GFSH	all groundfish species, including PLCK, PCOD, FLAT, and ARSO
non-GFSH	all non-groundfish species harvested in Alaska commercial fisheries, including salmon, crab, halibut, and herring
OTAM	other groundfish and Atka mackerel combined
OTHR	other groundfish
SABL	sablefish
AMCK	Atka mackerel
CRAB	crab
ROCK	all rockfish
HALB	halibut
HERR	herring
SALM	salmon
Other	all other species

1.1 Surimi Trawl Catcher Processors (ST-CP)

These factory trawlers have the necessary processing equipment to produce surimi from pollock and other groundfish. They are generally the largest of all catcher processors.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

Table 1.1-1. Number of Surimi Trawl Catcher Processors by Species, 1992-2000

YEAR	Number of Processors by Species				
	ARSO	FLAT	PCOD	PLCK	Total

2000	1,310	11	119	108

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for vessels were estimated using NMFS Observer Data (June 2001) on the number of crew when the vessel was operating fishing? These data were adjusted to account for the longer work days on vessels (16-hour days for STP, FTP, MS, and FLT, and 12-hour days for other processing vessel classes), assuming an average of 6 work days per week (to account for partial weeks), and dividing by 52 weeks in year.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

Average vessel crew size is derived from NMFS Observer Data

1.2 Fillet Trawl Catcher Processors (FT-CP)

These trawl vessels have the processing equipment to produce fillets from pollock, Pacific cod, and other groundfish. They are generally smaller than ST-CPs.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

1998	1,035	12	86	76
1999	328	4	82	79
2000	345	4	86	86

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for vessels were estimated using NMFS Observer Data (June 2001) on the number of crew when the vessel was operating fishing? These data were adjusted to account for the longer work days on vessels (16-hour days for STP, FTP, MS, and FLT, and 12-hour days for other processing vessel classes), assuming an average of 6 work days per week (to account for partial weeks), and dividing by 52 weeks in year.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

Average vessel crew size is derived from NMFS Observer Data

1.3 Head and Gut Trawl Catcher Processors (HT-CP)

These factory trawlers do not process more than an incidental amount of fillets. Generally, they are limited to headed and gutted products or kirimi. In general, they do not focus their efforts on pollock,

opting instead for flatfish, Pacific cod, and Atka mackerel. HT-CPs are the smallest of the trawl catcher processors.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for vessels were estimated using NMFS Observer Data (June 2001) on the number of crew when the vessel was operating fishing? These data were adjusted to account for the longer work days on vessels (16-hour days for STP, FTP, MS, and FLT, and 12-hour days for other processing vessel classes), assuming an average of 6 work days per week (to account for partial weeks), and dividing by 52 weeks in year.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

Average vessel crew size is derived from NMFS Observer Data

1.4 Pot Catcher Processors (P-CP)

These vessels have been used primarily in the crab fisheries of the North Pacific, but increasingly are participating in the Pacific cod fisheries. They generally use pot gear, but may also use longline gear. They produce whole or headed and gutted groundfish products, some of which may be frozen in brine rather than blast frozen.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

Total groundfish FTE positions for vessels were estimated using NMFS Observer Data (June 2001) on the number of crew when the vessel was operating fishing? These data were adjusted to account for the longer work days on vessels (16-hour days for STP, FTP, MS, and FLT, and 12-hour days for other processing vessel classes), assuming an average of 6 work days per week (to account for partial weeks), and dividing by 52 weeks in year.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

Average vessel crew size is derived from NMFS Observer Data

1.5 Longline Catcher Processors (L-CP)

These vessels, also known as freezer longliners, do not trawl or use pot gear but use longline gear with a focus on Pacific cod. Most L-CPs are limited to headed and gutted products, and in general are smaller than HT-CPs.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

1998	782	42	19	19
1999	719	39	18	19
2000	823	41	20	19

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for vessels were estimated using NMFS Observer Data (June 2001) on the number of crew when the vessel was operating fishing? These data were adjusted to account for the longer work days on vessels (16-hour days for STP, FTP, MS, and FLT, and 12-hour days for other processing vessel classes), assuming an average of 6 work days per week (to account for partial weeks), and dividing by 52 weeks in year.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

Average vessel crew size is derived from NMFS Observer Data

1.6 Bering Sea Pollock Inshore Plants (BSP-SP)

Includes the four major shorebased BSAI pollock processors in Dutch Harbor/Unalaska and Akutan. Also includes two inshore floating processors—*Arctic Enterprise* and *Northern Victor*—that have had substantial pollock history and function from a single location in state waters off Unalaska and Akutan Islands

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

1998	1,898	6	316
1999	2,146	6	358
2000	2,765	6	461

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for shore plants were estimated using NMFS WPR data for each year, and dividing by the amount of product per labor hour. Productivity information was taken from Northern Economics (1990 and 1994), and adjusted if necessary to reflect more recent productivity information derived from NMFS Observer Data. The product of these data was divided by 1,780 working hours per year (after vacations, holidays, sick leave, etc.) to arrive at a total groundfish FTE employment by sector.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

1.7 Alaska Peninsula and Aleutian Islands Inshore Plants (APAIOSP)

Includes all shore plants in the Aleutians East Borough and in the Aleutians West Census Area, excluding all BSP-SPs. In general, these plants are much smaller than BSP-SPs, do not have the same level of focus on BSAI pollock, and in some cases produce more salmon than groundfish. These plants are treated separately from the BSP-SPs because of these operational differences.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

1998	1,898	6	316
1999	2,146	6	358
2000	2,765	6	461

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for shore plants were estimated using NMFS WPR data for each year, and dividing by the amount of product per labor hour. Productivity information was taken from Northern Economics (1990 and 1994), and adjusted if necessary to reflect more recent productivity information derived from NMFS Observer Data. The product of these data was divided by 1,780 working hours per year (after vacations, holidays, sick leave, etc.) to arrive at a total groundfish FTE employment by sector.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

1.8 Kodiak Inshore Plants (K-SP)

This class includes all shore plants in the Kodiak archipelago. Many of these plants focus on groundfish but also process some salmon and halibut. Others focus on salmon and halibut but also process some groundfish.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

1997	406	6	68
1998	384	6	64
1999	461	8	58
2000	351	8	44

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for shore plants were estimated using NMFS WPR data for each year, and dividing by the amount of product per labor hour. Productivity information was taken from Northern Economics (1990 and 1994), and adjusted if necessary to reflect more recent productivity information derived from NMFS Observer Data. The product of these data was divided by 1,780 working hours per year (after vacations, holidays, sick leave, etc.) to arrive at a total groundfish FTE employment by sector.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

1.9 Southcentral Alaska Inshore Plants (SC-SP)

This class includes all shore plants in the Kenai Peninsula Borough, the Municipality of Anchorage, the Matanuska-Susitna Borough, and the Valdez-Cordova Census Area. In general, these processors focus on salmon and halibut but also process some groundfish.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for shore plants were estimated using NMFS WPR data for each year, and dividing by the amount of product per labor hour. Productivity information was taken from Northern Economics (1990 and 1994), and adjusted if necessary to reflect more recent productivity information derived from NMFS Observer Data. The product of these data was divided by 1,780 working hours per year (after vacations, holidays, sick leave, etc.) to arrive at a total groundfish FTE employment by sector.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

1.10 Southeast Alaska Inshore Plants (SE-SP)

This class includes all shore plants in Southeast Alaska from Yakutat to Ketchikan. In general, these processors focus on salmon and halibut, but also process some groundfish, primarily high-value species such as rockfish and sablefish.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

1998	384	10	38
1999	461	12	38
2000	351	11	32

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for shore plants were estimated using NMFS WPR data for each year, and dividing by the amount of product per labor hour. Productivity information was taken from Northern Economics (1990 and 1994), and adjusted if necessary to reflect more recent productivity information derived from NMFS Observer Data. The product of these data was divided by 1,780 working hours per year (after vacations, holidays, sick leave, etc.) to arrive at a total groundfish FTE employment by sector.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

1.11 Motherships (MS)

This class includes all motherships operating in the EEZ. Currently there are only three active motherships. This class does not include floating processors that operate exclusively in state waters.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

^eTotal value of final product per round weight ton reported (column 4 ÷ column 1).

Table 1.11-10. Estimated Full-Time Equivalent Employment Generated by Groundfish-Related Activity by Motherships Operating in the BSAI or GOA, 1992-2000

Year	Total Groundfish FTE Employment	Total Number of Facilities	Average Groundfish FTE Employment	Average Vessel Crew Size
1992	267	12	22	19
1993	305	14	22	19
1994	272	16	17	17
1995	301	16	19	19
1996	379	16	24	19
1997	406	14	29	20
1998	384	15	26	19
1999	461	12	38	19
2000	351	13	27	19

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for vessels were estimated using NMFS Observer Data (June 2001) on the number of crew when the vessel was operating fishing? These data were adjusted to account for the longer work days on vessels (16-hour days for STP, FTP, MS, and FLT, and 12-hour days for other processing vessel classes), assuming an average of 6 work days per week (to account for partial weeks), and dividing by 52 weeks in year.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.

Average vessel crew size is derived from NMFS Observer Data

1.12 Floating Inshore Plants

This class includes all inshore floating processors.

For this processor class the following tables describe the number of processors, tons of groundfish reported, wholesale production value, and wholesale value for roundweight harvest by species; wholesale production value by product type; tons and wholesale production value of groundfish by FMP subarea; wholesale value of all products from top three target fisheries; landing of target species in target fisheries; wholesale value of products from target species; processing summary; and estimated full-time employment.

Table 1.12-9. Processing Summary of Floating Inshore Plants, 1992-2000

YEAR	Round Weight Tons (Thousands) ^a	Product Tons (Thousands) ^b	Utilization Rate (Product Tons/Round- weight Tons) ^c	Wholesale Value (\$Millions) ^d	\$/Round- weight Ton ^e
1992	21.65	10.04	0.46	16.18	747
1993	3.87	2.23	0.58	5.31	1,373
1994	4.67	2.01	0.43	4.52	967
1995	12.36	5.37	0.43	9.64	780
1996	9.98	4.31	0.43	7.27	728
1997	5.49	1.81	0.33	4.64	845
1998	1.47	0.80	0.54	1.41	958
1999	3.05	2.95	0.97	3.52	1,153
2000	18.04	7.73	0.43	20.85	1,156

^aTotal groundfish reported tons—retained and discarded from NMFS Blend Data, June 2000.^bTotal groundfish final product from NMFS Weekly Production Reports, June 2000.^cTotal final product as a percent of total groundfish reported tons (column 2 ÷ column 1).^dTotal final product value from NMFS Weekly Production Reports with product prices from ADF&G Commercial Operator Annual Reports.^eTotal value of final product per round weight ton reported (column 4 ÷ column 1).**Table 1.12-10. Estimated Full-Time Equivalent Employment Generated by Groundfish-Related Activity by Floating Inshore Plants, 1992-2000**

Year	Total Groundfish FTE Employment	Total Number of Facilities	Average Groundfish FTE Employment	Average Vessel Crew Size
1992	267	5	53	NA
1993	305	3	102	NA
1994	272	4	68	NA
1995	301	4	75	NA
1996	379	3	126	NA
1997	406	3	135	NA
1998	384	3	128	NA
1999	461	3	154	NA
2000	351	3	117	145

Source: Calculated by Northern Economics from NMFS Blend and Weekly Production Report Data.

Total groundfish FTE positions for shore plants were estimated using NMFS WPR data for each year, and dividing by the amount of product per labor hour. Productivity information was taken from Northern Economics (1990 and 1994), and adjusted if necessary to reflect more recent productivity information derived from NMFS Observer Data. The product of these data was divided by 1,780 working hours per year (after vacations, holidays, sick leave, etc.) to arrive at a total groundfish FTE employment by sector.

Total number of facilities is from NMFS Blend Data.

Average groundfish FTE is the total groundfish FTE divided by the number of facilities.
